

## ABSTRACT

[0028] The present invention comprises an improved ultrasonic transducer mount including a removable union sleeve engaged with a transducer holder sleeve on the mount. The union sleeve has an outer diameter that engages an extractor tool for removal of the transducer and transducer holder from the mount. A retaining ring holds the union sleeve in place on the outside of the transducer holder sleeve.

FIG. 30 is a cross-sectional view of the transducer holder sleeve and union sleeve assembly.
